

FLUID COOLING | Shell & Tube B Series

COPPER & STEEL CONSTRUCTION

Features

- Young Touchstone Interchange
- Optional Non-Ferrous Construction
- Competitively Priced
- 1/4" or 3/8" Tubes Standard
- Water to Water Applications
- Sea Water Applications
- Optional 90/10 Copper Nickel Cooling Tubes and Bronze End Bonnets for Sea Water Service
- NPT, SAE O-Ring, SAE Flange, or BSPP Shell Side Connections Available
- End Bonnets Removable for Servicing
- Mounting Feet Included (May be Rotated in 90° Increments)

WATER COOLED B

Ratings

- Maximum Shell Pressure** 250 psi
- Maximum Tube Side Pressure** 150 psi
- Maximum Temperature** 350° F

Materials

- Tubes** Copper
- Hubs & Tubesheets** Steel or Brass
- Shell** Steel or Brass
- Baffles** Brass
- End Bonnets** Cast Iron
- Mounting Brackets** Steel
- Gaskets** Nitrile Rubber/Cellulose Fiber
- Nameplate** Aluminum Foil

How to Order

ADD FOR B SERIES MODELS ONLY:
BR-CN-B-Z is to be used for all seawater/dirty water applications.

Steel Hub

- SB** = NPT Shell Side, NPT Tube Side
- SBF** = SAE Flange (with UNC threads) Shell Side connections; NPT Tube Side connections

Brass Hub

- B** = NPT Shell Side connections; NPT Tube Side connections
 - BS** = SAE O-Ring Shell Side connections; NPT Tube Side connections
 - BM** = BSPP Shell Side connections; BSPP Tube Side connections
 - BF** = SAE Flange (with UNC threads) Shell Side connections; NPT Tube Side connections
 - BFM** = SAE Flange (with Metric threads) Shell Side connections; BSPP Tube Side connections
- SAE flanges available on some models. Consult factory for details.

B - 1003 - C4 - F

Unit Size	Shell Side (GPM)		Baffle Spacing		Tube Side (GPM)		
	A	B	C	D	O	T	F
400	9.6	—	—	—	25	—	—
700	17	29	29	—	61	31	15
1000	24	48	69	69	146	73	37
1200	29	57	115	115	224	112	56
1600	37	74	149	253	363	181	91

Caution: Incorrect installation can cause this product to fail prematurely, causing the shell side and tube side fluids to intermix.

Piping Hook-up

Specific applications may have different piping arrangements. Contact factory for assistance.

Selection Procedure

Performance Curves are based on 100SSU oil leaving the cooler 40°F higher than the water temperature used for cooling. This is also referred to as a 40°F approach temperature. Curves are based on a 2:1 oil to water flow ratio. *Curves are 1:1.

Step 1 Determine the Heat Load. This will vary with different systems, but typically coolers are sized to remove 25 to 50% of the input nameplate horsepower. (Example: 100 HP Power Unit x .33 = 33 HP Heat load.)
If BTU/Hr. is known: $HP = \frac{BTU/Hr}{2545}$

Step 2 Determine Approach Temperature. Desired oil leaving cooler °F – Water Inlet temp. °F = Actual Approach (Max. reservoir temp.)

Step 3 Determine Curve Horsepower Heat Load. Enter the information from above:
Horsepower heat load x $\frac{40}{\text{Actual Approach}}$ x Viscosity Correction A = Curve Horsepower

Step 4 Enter curves at oil flow through cooler and curve horsepower. Any curve above the intersecting point will work.

Step 5 Determine Oil Pressure Drop from Curves:
○ = 5 PSI; □ = 10 PSI; ● = 20 PSI. Multiply pressure drop from curve by correction factor B found on oil viscosity correction curve.

Oil Temperature

Oil coolers can be selected using entering or leaving oil temperatures.

Typical operating temperature ranges are:

Hydraulic Oil	110°F - 130°F
Hydrostatic Drive Oil	130°F - 180°F
Bearing Lube Oil	120°F - 160°F
Lube Oil Circuits	110°F - 130°F

Desired Reservoir Temperature

Return Line Cooling: Desired temperature is the oil temperature leaving the cooler. This will be the same temperature that will be found in the reservoir.

Off-Line Recirculation Cooling Loop: Desired temperature is the oil temperature *entering* the cooler. In this case, the oil temperature change must be determined so that the actual oil leaving temperature can be found. Calculate the oil temperature change (oil ΔT) with this formula:

$$\text{Oil } \Delta T = (\text{BTU's/Hr.}) / (\text{GPM Oil Flow} \times 210).$$

To calculate the oil leaving temperature from the cooler, use this formula:

$$\text{Oil Leaving Temp.} = \text{Oil Entering Temp} - \text{Oil } \Delta T.$$

This formula may also be used in any application where the only temperature available is the entering oil temperature.

Oil Pressure Drop: Most systems can tolerate a pressure drop through the heat exchanger of 20 to 30 PSI. Excessive pressure drop should be avoided. Care should be taken to limit pressure drop to 5 PSI or less for case drain applications where high back pressure may damage the pump shaft seals.
